

News Release

Bergamo, March 2021

ERCA SPA has always paid particular attention to sustainability, offering technical solutions to improve and optimize the efficiency of processing cycles, with the aim of contributing not only to minimize the consumption of water and of energy, but also to reduce the use of virgin natural resources.

Three years ago, our company adopted a more sustainable approach using vegetable waste as secondary raw materials to produce chemicals.

Today thanks to the synergies of our R&D Teams and the collaboration with our Partners, we are pleased to offer our customers textile auxiliaries synthesized from used vegetable oils: a range of levelling and dispersing agents for dyeing polyester, polyamide and protein fibres.

Unique Textile Chemical Auxiliaries Certified GRS (Global Recycled Standard)

Listed in GATEWAY of ZDHC – bluesign® and GOTS approved

This new generation of Eco-friendly and sustainable textile chemicals has proven a high level of performance and effectiveness compared to conventional products.

REVECOL's for polyester dyeing are carrier free and can be used as one versatile product, due to the combined levelling, dispersing and migrating properties.

On polyamide and protein fibres, REVECOL levelling agents ensure an excellent control of dye uptake allowing uniform distribution of dyes, a build-up on tone and an excellent quality of dyeing.

Our developments continue and a series of new products have passed the last tests of performance, and we are confident that shortly a complete product range will be available including detergents, dyeing auxiliaries and finishing.

We offer our customers textile chemicals based on recycled raw materials to upgrade their valuable articles.

Act now for the benefits of your sustainable commitments, your target is our priority because we share the same values.

This is our contribution for the global sustainable development plan 2030
